

Delivery Pilot — Page Rewrite

One identity: an embedded delivery + upskilling program. Written for a delivery-accountable technical leader (Head of Platform Engineering / delivery lead). Every section leads with a recognisable pain, keeps the promise and mechanism congruent, and frames value in the buyer's own terms.

HERO

Your last production outage wasn't a technology failure. It was a delivery failure.

An expired certificate takes down production. A key person leaves and the AI project stalls. The skills gap nobody flagged becomes the deadline nobody hits. These aren't AI problems — they're delivery problems, and most enterprise AI initiatives die on exactly this ground.

Delivery Pilot embeds a certified pilot inside your team to close the skills gap *while the work ships* — through hands-on simulation workshops and certification, not slideware. You get delivery capability that stays after we leave.

[Find your delivery gap] [See the 10-step workshop]

THE RAISE CHALLENGE

Rapid AI is raising the bar faster than teams can clear it.

Every quarter brings new tools, frameworks, and "best practices." Your people are expected to keep up *and* deliver. The gap between what's now required and what the team can do today isn't a training-budget line item — it's the thing quietly putting your deadlines at risk.

The problem isn't ambition. It's the gap between strategy and the hands that have to execute it.

Delivery Pilot closes that gap three ways — all of them hands-on, all of them inside your team:

Skills Gap Assessment — We map what your team can deliver today against what your AI initiative actually demands, and pinpoint exactly where delivery will break.

Collaborative Simulation Workshops — Your people build real AI-agent solutions alongside a pilot, in your context, on scenarios that mirror your systems — learning by shipping, not by watching.

Pilot Certification — We certify the people who can carry it forward, with specific focus on technical-debt management and security compliance — the two places delivery quietly rots.

[Assess your delivery readiness] [View the 10-step workshop process] [See the 12-step programme]

WHERE ENTERPRISE AI PROJECTS GO WRONG

Most enterprise AI projects don't fail on strategy. They fail on execution.

They stumble on the same three things every time: missing specialised skills, mounting technical debt, and no one who can answer the question that actually matters — *"What do we do with this, here, on our systems?"*

The challenge The distance between "we should use AI" and a thing running safely in production is filled with technical debt and skills gaps. Closing those gaps is the whole job — and it's the part most programs skip.

The approach We embed an expert Delivery Pilot in your team to do the work *with* your people, not for them. They build real solutions, transfer the skill by doing, and leave your team able to run it.

The result Strategy and execution finally meet. Your AI initiative launches, scales, and — critically — keeps running once we're gone, because the capability now lives in your team.

[Deploy a pilot]

WHAT AN EMBEDDED PILOT ACTUALLY DOES

(This replaces the generic PaaS feature grid. Each point is a delivery capability a person brings, not a platform claim — so the promise and the mechanism stay congruent.)

Ships in your environment A pilot works on your systems, your constraints, your codebase — so what gets built actually runs where it needs to, not in a demo sandbox.

Hardens security and compliance as it builds GDPR, SOC 2, HIPAA — handled as delivery decisions during the work, not bolted on after. The people we certify know how to keep it that way.

Attacks technical debt on the way in Every solution is built to be maintained by your team, not to become the next thing nobody can touch. Debt management is part of the delivery, not a future clean-up project.

Prevents the outages you already know about Expired certificates, silent failures, manual processes that break under load — a pilot builds the monitoring and hand-off that stops these before they reach production.

Transfers the skill, not just the code The point isn't a deliverable. It's a team that can build the next one without us. Every engagement ends with people, not just artefacts.

Certifies who can carry it forward When we hand off, you know exactly who on your team is qualified to fly it — because we've assessed and certified them against real delivery.

HOW IT WORKS

A four-step engagement designed to leave capability behind, not dependency.

1 — Assess where delivery will break Before anything ships, we map your team's current delivery capability against what the initiative demands: skills, infrastructure readiness, and the technical-debt and security risks that will surface later. You get a clear picture of exactly where the gaps are.

Delivery-skills gap assessment

Current infrastructure and readiness review

Technical-debt and security-risk mapping

Realistic timeline and hand-off plan

2 — Design with your team, not for them We build the roadmap and architecture *with* the people who'll own it, so the plan is one your team understands and can defend — not a document that arrives and gets ignored.

Architecture designed for maintainability

Technology choices your team can support

Integration mapped to your real systems

Risk and compliance built into the plan

3 — Build and transfer by doing The pilot works inside your team, shipping real AI-agent solutions in hands-on simulation workshops built on your scenarios. Skills transfer because your people are building alongside — this is where the gap actually closes.

Real solutions built in your environment

Hands-on workshops on your scenarios

Skill transfer through paired delivery

Security and testing validated in-flight

4 — Certify and hand off We certify the people who can carry the work forward and hand off cleanly, with the monitoring and safeguards in place to keep it running. You're left with capability, not a support contract you can't escape.

Pilot certification for your team

Proactive monitoring and safeguards in place

Clean hand-off, documented

Optional check-ins as your team scales it

USE CASES

Where an embedded pilot pays for itself first.

Certificate management — stop the outages you can predict Expired certificates cause production outages that are entirely preventable. Pilots build agents that monitor, renew on time, and notify stakeholders — turning a recurring firefight into a solved problem, and teaching your team to keep it solved.

Customer service automation Intelligent agents that handle real customer needs — built to your policies and integrated with your systems, not dropped in as a black box.

Predictive analytics Forecasting and decision-support your team can actually maintain, because they helped build the models.

Document intelligence Extraction, classification, and analysis automated against your document types and your compliance requirements.

Quality assurance AI-driven quality control that fits your existing QA process instead of replacing it wholesale.

ABOUT DELIVERY PILOT

Delivery Pilot is a program that puts expert delivery capability *inside* your team — not another platform to learn.

Most enterprises don't lack AI ambition or AI tools. They lack the specialised, hands-on delivery skill to turn either into something that runs safely in production and keeps running. That's the gap we close.

We embed certified Delivery Pilots who build real solutions alongside your people, close skills gaps by doing the work, and manage technical debt and security compliance as they go. When we hand off, the capability stays with your team.

How we grow: through trust and reach — sharing real delivery insight on our [founder's YouTube channel](#), and extending our capacity through a [partner network](#) that delivers across global markets.

PROOF

(Replace vanity metrics with outcomes a buyer recognises as their own. Placeholders below — fill with real figures.)

[N] production certificate outages eliminated Across the systems where pilots deployed proactive monitoring.

[N] teams certified to deliver independently People who can now ship AI-agent solutions without us.

[N]% faster to a maintainable production deployment Measured against the client's own prior baseline.

Notes for whoever builds this out

Kill the identity split. Remove "Everyone can make apps," "state-of-the-art PaaS," "one-click deployment," and "auto-scaling" everywhere. They contradict the embedded-pilot story and reintroduce the trust-eroding incongruence.

The certificate-management use case is your strongest hook. It's specific, painful, and recognisable. It leads the hero and opens the use-case section on purpose — don't bury it again.

Every stat needs a source or a baseline. ">1% in GitHub with +200 repos" reads as confusing self-reference, not proof. Swap for outcomes the buyer would claim as their own.

Name the buyer once you've confirmed them. This draft assumes a delivery-accountable technical leader. If it's a CIO, an innovation lead, or a line-of-business owner, the pains and proof should shift accordingly.
